# The City of Madison Traffic Volume Report

## **Introduction**

The annual City of Madison Traffic Volume Report is a statistical summary of monthly traffic volume data obtained from twenty one control locations. Motor vehicle traffic counts are performed at nine street locations (five arterial, two collector, and two residential) and bicycle traffic counts are obtained from seventeen bicycle path locations.

At the end of each year the monthly data is compiled and analyzed. For each of the three street classifications, average weekday traffic (AWT) is calculated by hour, month and year, and monthly and hourly factors are generated. The counts from the seventeen bicycle control stations are averaged together to compute the annual average for each location. Three of the bicycle control stations are averaged together to compute the average monthly count, the annual average, the April-October average, and the November-March average.

## **Hourly Factors**

Analysis indicates that traffic variations follow regular, repeating and seasonal patterns. These patterns can be mathematically represented as monthly or hourly factors. Traffic engineers use these factors to predict traffic at locations other than the control locations.

For example, each hour can be represented as a percentage of the day's AWT and each month as a percentage of the year's AWT. Monthly and hourly factors are then generated from these percentages. Sample counts or traffic studies performed on any street and at any time throughout the year are then multiplied by the appropriate factor to produce a reasonable estimate of the AWT for that particular street.

## **Screen Lines**

In addition, the report also contains "screen line" traffic volumes. A screen line is a group of count stations along a strategically placed imaginary line. Summing traffic data along this line will indicate the volume of traffic entering or leaving particular areas of the city. Traffic engineers use screen line information to detect changes in travel patterns due to growth, development or changes in land use.

## **Traffic Volume Data and Rounding Errors**

Efforts are made to count traffic on typical days when events which may cause unusually high or low volumes are not scheduled, however, some events cannot be avoided such as bad weather or road construction. Therefore, some reported data may not be typical and will be noted as such.

Also, please note that the methods used to calculate the averages in this report will produce some rounding errors.

# **Bike Path Count Data**

**From Monthly Counts Stations**

# Bike Path Counts Report

## Introduction

In the past, the annual City of Madison Traffic Volume Report has used 3 bicycle locations as control points for bicycle data collection. In recent years we have added additional bicycle count stations as ridership and demand has increased. The following report shows the data for all the added bicycle stations, plus the standard 3 control points.

At the end of each year the monthly data is compiled and analyzed. The counts from all of the bicycle stations are averaged together to compute the average monthly count and annual average. The counts from the three bicycle control stations are averaged together to compute the average monthly count, the annual average, the April-October average, and the November-March average.

## Counting Process

Bicycles are counted using digital loop detectors buried underneath the asphalt using a quadrupole configuration and connected to either a traffic signal or stand-alone traffic counter. The buried loops use the metal content of a passing bicycle to detect and count all the directional data. Most loop data that is connected to a traffic signal can be retrieved via a phone line and compiled on a monthly basis. Loop data that is connected to a standalone traffic counter must be retrieved manually and is compiled on a seasonal basis.

## Eco Counter Stations

The City of Madison Traffic Engineering Division has added two Eco Counters for bicycles. These counters display current count data; time, daily total and yearly total. The daily total will automatic increase as a bicyclist rides over the electronic detector loop(s).

An online map is also available to the general public. A click on the Eco Counter unit icon will display yesterday's total, daily average and date select total. The web site also can produce a graph illustrating days, weeks and months data. It has the capability to retrieve and display historical and current count data if a specific date or range is selected and validated. This online map can be found at this link: <http://eco-public.com:8080/ParcPublic2/?id=4586>

## Possible Errors

Efforts are made to count traffic on typical days (when events which may cause unusually high or low volumes are not scheduled), however, some factors cannot be avoided such as bad weather or road/bike path construction.

Due to their relatively low metal content, bicycles have historically been the most difficult vehicles to detect. The City of Madison installs special types of loop detectors which are more sensitive in order to better detect bicycles. The different types of materials used for bicycles (aluminum, steel, titanium, carbon fiber, etc.) all are detected differently and may cause errors.

Also, please note that the methods used to calculate the averages in this report will produce some rounding errors.
